

Build Engaging Applications on the Cloud

Challenges

Siloed Customer Data

Your goal is not to simply create applications, it's to create compelling experiences that innovate within your industry. To do that, you need insight, customer data, and an understanding of user behavior. While that data may already exist, it is likely siloed and hard to integrate with your application development efforts.

Inefficient Infrastructure Management

When resources are spent maintaining infrastructure, development cycle times can lag. In a world of consumers that expect new, innovative applications rapidly, splitting focus between forward-facing application development and internal infrastructure management can slow business initiatives.

Insufficient Tooling

Developers can create great applications when they have great tools at their disposal. Often, development teams find themselves without the toolset required to build the engaging applications they envision.

The Salesforce Solution

Adopting an End-to-End Development Platform

Salesforce Heroku is an AWS-native, end-to-end application development platform. By reducing the amount of time your team must dedicate to infrastructure management, you can accelerate the speed in which you develop engaging, enterprise-grade applications. You can sync Salesforce Heroku with all of your Salesforce Clouds, making it easy to develop customer- and data-driven applications with 360° customer profiles.

Key Benefits

Build Engaging Applications Based on Customer Context

By leveraging the fluid integrations with AWS services and your Salesforce Clouds, you can build personalized, engaging applications with Salesforce Heroku and enrich customer data throughout your organization. With the expansive breadth of AWS services and the pace of innovation, you can streamline the integration of legacy and emerging technologies into your development environments, with a lower risk than you would traditionally have in on-premises environments.

Salesforce Heroku syncs directly with your Salesforce Clouds, so you are able to share customer data between disparate business units. This enables you to create more robust applications, built from real-time insights on customer issues.

Focus on Application Development, Not Infrastructure Management

Once Salesforce Heroku is up and running, it is easier to build, test, and deploy applications that adhere to AWS best practices for security and operations.

To further operational efficiency, Salesforce Heroku provides you with a point-and-click dashboard that allows you to collaborate with and manage team members across different stages of development.
